# **CHAPTER 7 – ASSET INVENTORY PROGRAM**

#### 7.1 Introduction

An integral part of the WRMP is identifying and recording GWA assets in both the water and wastewater systems. This effort entails developing a program that catalogs existing assets and also provides a system going forward for incorporating new and modified assets in a format that allows users to establish monetary values for use in record keeping for costing models. Chapter 8 – Asset Management of this volume, presents details on the ultimate use of the asset inventory. Some of the tools used in formulating the asset management program are discussed in this chapter.

#### 7.2 Overview

GWA owns thousands of assets, including pumps, motors, valves, buildings, and pipes. Each one has a current value and a replacement cost. Identifying these assets is critical to determining the long-term cost of a capital improvement program.

Historical data and other information about these assets are deficient. Records have been lost, nameplates have corroded, and institutional knowledge has left GWA over the years. To obtain the best possible information about GWA's assets, and to set the stage for future information management, a database was developed for on-site field collection of asset information. The data collection tool is called InfoCollect, and it was developed using Microsoft Access as the database software. InfoCollect was developed for use on tablet computers to facilitate field data collection.

Three teams were developed to collect asset information, each dedicated to a different area of data compilation:

- 1. The wastewater treatment plants and the Ugum Water Treatment Plant
- 2. The wastewater pumping stations
- 3. The wells, water booster pumping stations, and reservoirs

Underground assets, including pipes in the water distribution system and the wastewater collection system, were inventoried through the development of GWA's GIS, which is discussed in Chapter 9 – GIS Program.

InfoCollect enables the teams to develop the inventory and to populate the design data in the field. Figure 7-1, Typical Facility Screen Capture in InfoCollect shows a typical screen capture for a facility. The menu on the left provides a dropdown menu for locating facilities and their respective assets in each village and by system type. Figure 7-2, Typical Asset Information Collection in InfoCollect shows typical design data that are collected for each asset. The fields vary depending on the asset.

Though the database was intended to be used to collect condition assessment information, a separate, single team, using a separate condition assessment tool, conducted the condition assessment. This change was made to ensure consistency in evaluating the condition of equipment. The condition assessment is discussed in Volume 2, Chapter 7 – Water System Condition Assessment and Volume 3, Chapter 4 – Wastewater Condition Assessment, for the water and wastewater systems, respectively.

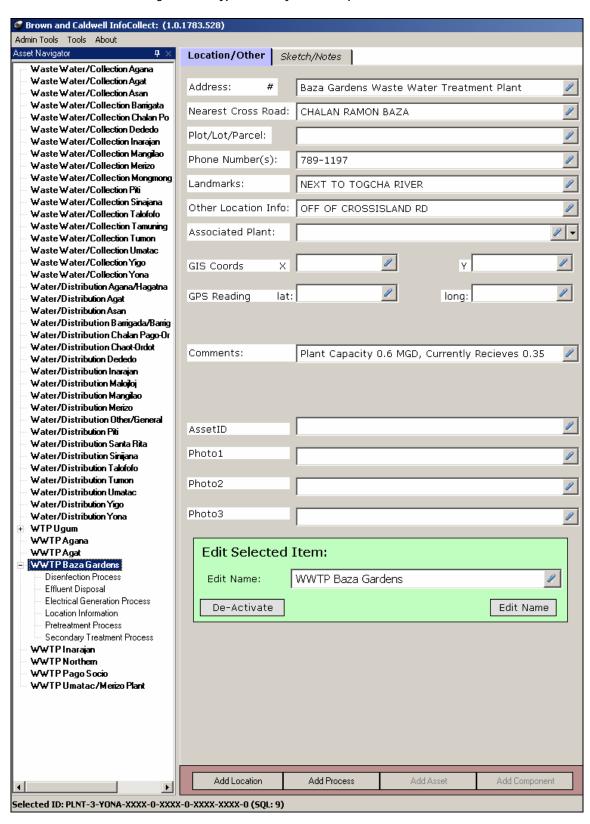

Figure 7-1 – Typical Facility Screen Capture in InfoCollect

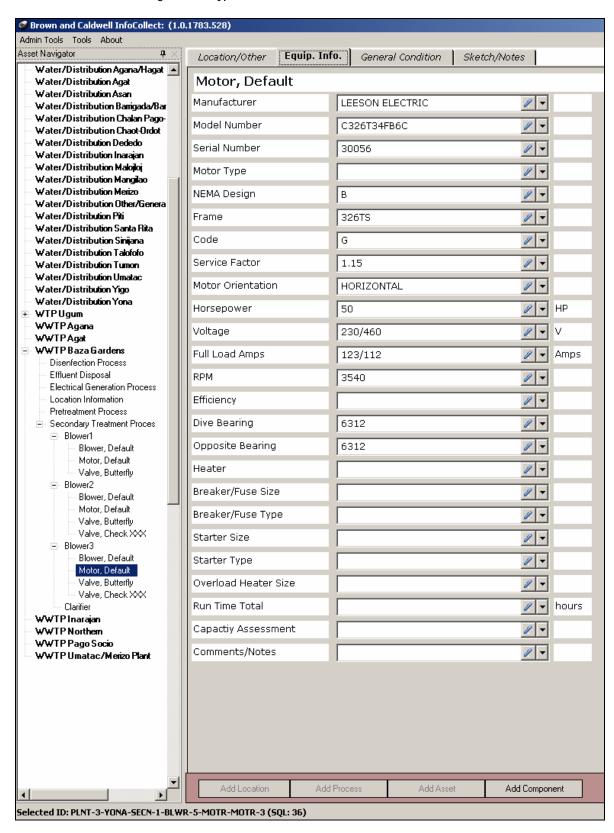

Figure 7-2 - Typical Asset Information Collection in InfoCollect

As assets are added to the database, a unique asset identification number is developed. The description below shows two examples of how the asset ID is developed. A table of descriptors follows each of the acronyms/numbers of the asset ID that are highlighted in red. All other asset IDs can be interpreted in the same manner. Figures 7-3 through 7-8 illustrate asset identification development.

Figure 7-3 — System Designator Portion of Asset ID

Asset ID: COLL-9-MANG-INFP-5-BLDG-1-BLDG-BLDG-1

• Description – Associated with the wastewater collection system

Asset ID: DIST-19-MALO-BPMP-2-PUMP-25-VALV-VGAT-5

• Description – Associated with the water distribution system

Acronym	Description
ADMI	Administration

### 7.3 Equipment and Maintenance Submittal Requirements

The purpose of this procedure is to develop a means by which information for new equipment pertinent to GWA's asset inventory can be acquired. It eliminates the time-consuming task by GWA staff of extracting information from volumes of O&M manuals and from equipment nameplates. The procedure should be incorporated into GWA's procurement process for its most effective use. The procedure can be adapted easily as a specification for new equipment.

- Step 1. Provide specific maintenance information inserted in pre-labeled file folders, as described in Step 5 below, for each unit of mechanical, HVAC, electrical, and instrumentation equipment or system and each instrument. Maintenance information provided under this section is in addition to any similar data that are included in standard vendor or manufacturer's O&M manuals.
- Step 2. Provide a tab for each section as described in Step 5. Insert in each file folder the specific information described in Step 5.
- **Step 3.** The following instructions apply to forms XXX-A, XXX-B, and XXX-C.
  - Submit forms on colored paper as follows:
    - XXX-A Canary
    - XXX-B Green
    - XXX-C Blue
  - Type the information onto the appropriate color-coded form.
  - Type N/A (not applicable) into any information box for which the requested information is not applicable to the subject equipment.
  - Identify the units of measurement for numerical values.
  - Leave the following boxes blank:
    - Date Installed
      - Date of Warranty
    - Purchase Order #
    - Purchase Cost
  - No substitutions for completion of these forms are permitted.
- **Step 4.** When more than one identical piece of equipment or instrument is supplied, follow the steps below:
  - Provide completed color-coded form XXX-A and XXX-B, as appropriate, in Tab 1 of a separate file folder for each individual piece of equipment.
  - Provide completed color-coded form XXX-D in Tab 2 of the file folder for the individual piece of equipment described above.
- **Step 5.** Insert the specific information described below in the file folders:
  - Tab 1 Equipment Data

 Insert completed color-coded form XXX-A, Mechanical Equipment Data Record Form; or XXX-B, Electrical Equipment Data Record Form, as appropriate.

#### ■ Tab 2 – Maintenance Information

Insert completed color-coded form XXX-C, Equipment Maintenance Requirement Record Form. Include on the form the description and schedule for all manufacturers' recommended routine maintenance procedures, including specific lubrication recommendations. Indicate with an "X" in the appropriate box whether the procedure is to be done daily, weekly, monthly, quarterly, semiannually, or annually; or fill in the hours of operation when the maintenance is required. (See sample record forms in Figures 7-9 through 7-11.)

#### 7.4 Verification Process

### 7.4.1 Verification and Completion by Operations and Maintenance Staff

- O&M staff will verify that the information has been submitted as required, will fill in the "Date Installed" blank, and will then submit to the Finance department. Payment to the vendor/supplier should be contingent upon proper completion of the vendor/supplier forms. If the forms are not properly completed, O&M staff should return them to the vendor/supplier.
- If the equipment is for GWA storeroom inventory, O&M staff will not fill in the "Date Installed" blank. When the equipment is actually installed, the O&M staff will fill in the "Date Installed" blank and submit the form to the data entry person for transfer of the information from storeroom inventory to its proper location in the database.

## 7.4.2 Verification and Completion by Finance Staff

• Finance staff will verify that the forms are completed properly and will fill in the "Date of Warranty," "Purchase Order #," and "Purchase Cost" information. Payment to the vendor/supplier should be contingent upon proper completion of the forms.

#### 7.4.3 Entry into Asset Inventory Database

- Finance staff will submit the completed forms to the person responsible for data entry. This person will enter the information into the asset inventory database and then return the forms to O&M staff for filing.
- If the equipment is for stores inventory, it will be entered in the database as an inventory item, and then transferred to the database once it is installed.

#### 7.5 Conclusions

An asset inventory database is a valuable tool for

Identifying and recording GWA assets in both water and wastewater systems.

- Preventing the loss of data when records are misplaced, equipment nameplates corrode, or personnel leave the organization.
- Allowing users to establish monetary values for costing models, especially current values and replacement costs. Chapter 8 – Asset Management of this volume presents further details on asset inventory use.

#### 7.6 Recommendations

Incorporate a procedure into the procurement process for providing new equipment information. Information provided by the manufacturer in a prescribed format will save GWA staff effort in incorporating the new asset into the inventory database.

# 7.7 CIP Impacts

An asset inventory database is a critical information tool for determining long-term capital improvement program costs.
